

## Current fiber optic cables and older fiber optic cables

### Overview

Some fiber optic cables fail in 5 years, turning brittle and suffering from high attenuation. Others, installed in the 1990s, are still running 10G traffic perfectly today. The problem is usually the protection around. Wireless, DOCSIS, and DSL technologies have required continuous outdoor infrastructure upgrades to increase speeds and capacity, and carriers have recognized the value of fiber as these incremental approaches typically include more optical fiber deeper into the network toward the subscriber. Corning invented the first low-loss optical fiber over 50 years ago, and since then Fiber optics have become essential for. When you invest millions in a fiber optic cable network, you are buying a long-term asset. However, with the rapid advancement of technology, questions arise about the future relevance of fiber optics. From FTTH optics to industrial applications, backbone transmission, and cloud data centers, fiber cables can last for decades under appropriate installation and handling.
