

Driving piles for communication towers

Overview

Two of the most common options are helical piles and concrete drilled shafts. For communication towers—whether lattice or monopole—the foundation system must do more than just hold up weight. It must resist uplift from wind, handle lateral loads, perform reliably in variable soils, and be practical to build in locations that are often remote or have constrained access. Helical piles are an excellent foundation for lattice communication towers due to their outstanding resistance to tension and compression loads both laterally and. CHANCE® Helical Piles and Anchors offer an ideal solution to mobilization issues where remote areas and a limited number of piles may be a concern. Helical piles and anchors are used in many utility applications, such as self-supporting towers, guyed structures, and substations. This document updates and replaces FHWA NHI-05-042 and FHWA NHI-05-043 as the primary FHWA guidance and reference document on driven pile foundations.
