

Dual-core switch functionality

Overview

Core switches come with features like non-blocking architecture, Quality of Service (QoS), and redundancy. As the central data traffic hub core switch, it guarantees a proper inter-device communication core switch. This determines network efficacy, dependability, and the speed at which information is exchanged. This article will discuss critical aspects of core switches, including their essential. There are different types of enterprise switches that perform various roles in these layer-based or hierarchical ethernet networks. I want to take down the old core later on but will gradually transfer the connected devices from old to the new core one at a time. Aside from implementing RSTP, VRRP, hard code access and trunk ports, is there any other recommendation you would like to add.
