

Grounding of the primary power distribution box foundation at the construction site

Overview

The grounding electrode system connects the building's electrical system to the earth. Various electrodes can be used, including metal water pipes, concrete-encased electrodes, ground rods, and ground rings (NEC 250). The protective grounding system, which includes conductor grounds and worker bonding, must be engineered to protect workers from hazardous. Navigating the grounding and bonding of electrical systems can be a tall task unless you have taken the time to familiarize yourself with the requirements of Article 250 of NFPA 70®, National Electrical Code® (NEC®). Equipment Protection: Grounding protects substation. IPMENT, STRUCTURES, ETC. IN ELECTRICAL STATIONS INCLUDING TRANSMISSION AND DISTRIBUTION SUBSTAT GR THAN 8 FT FROM THE FENCE. THE FENCE SHALL BE GROUNDED SEPARATELY FROM THE GRID UNLESS OTHERWISE NOTED ON THE A PROPRIATE PROJECT DRAWING. SEE APPLICATION. The function of earthing in an electric power system is to maintain the potential of current carrying as well as non-current carrying parts of equipment, apparatus and appliances connected to the system, and to ensure safety of equipment and personnel and correct operation of protective devices. Our customized live online or in-person group training can be delivered to your staff at your location. Grounding and bonding NEC installations rely on coordinated fault-current paths and stable system references.
