

## How many dBm is a 1 milliwatt optical transmitter

### Overview

Quick Answer: 0 dBm equals exactly 1 mW. Key Takeaway: A 3 dB increase doubles the linear milliwatt power, rapidly pushing sensitive Avalanche Photodiodes into saturation. Typical Fiber Attenuation: 0.350 dB/km (for standard single-mode fiber)

Note: Optical power measurements are wavelength-dependent. By definition: 0 dBm=1 mW Positive dBm values correspond to powers greater than 1 mW, while negative dBm values correspond to powers less than 1 mW. Mastering this mathematical relationship prevents catastrophic receiver overload and ensures precise link budget calculations across high-density fiber. dBm or dBmW (decibel-milliwatts) is a unit of power level expressed using a logarithmic decibel (dB) scale respective to one milliwatt (mW). It is commonly used by radio, microwave and fiber-optical communication technicians & engineers to measure the power of system transmissions on a log scale. The power conversion of dBm to mW is given by the formula:  $P(\text{mW}) = 1\text{mW} \cdot 10^{(P(\text{dBm})/10)}$  So 1dBm = 1. Use the calculator to see the correct.
