

How to determine if a switch network segment is connected

Overview

FastEthernet0/1 is up, line protocol is up (connected): This shows that the specific interface is connected (both physical access and line protocol are up), so it is ready to pass traffic. Thanks and I assume one of those multiple MAC will include the MAC of the switch on the other side?

The show mac-address command from the cli will show you which ports have multiple connections. It can be very useful at troubleshooting connectivity issues and physical port issues, check the status of physical ports, watch how much traffic is passing through the interface, which IP address. What is the easiest way to determine how 2 Cisco switches are connected via trunk port to determine a network topology for a tree network?

I can see the switches with on both sides, but it's not clear which is the parent switch. Is it possible to determine which one is the parent switch and which. Cisco IOS has many commands that help network engineers check the switch, see its settings, and fix problems quickly. These commands show information about ports, VLANs, spanning tree, MAC addresses, and more. Using these. When diagnosing a problem, the most important tool is an intimate understanding of your network: what connects to what, and where everything is both logically and physically. You almost need to visualize the packets going from one device to the next. While this tool does require some amount of Linux CLI knowledge, it is.
