

## Inheriting the excellent traditions of relay protection

### Overview

In 1901, the induction-type overcurrent relay was introduced, followed by ASEA (now ABB) launching the first time-delay overcurrent relay, TCB, in 1905, enabling graded protection. The current differential protection principle was proposed in 1908, and directional. Relay protection is a critical component of electrical power networks, providing rapid and reliable fault detection, isolation, and fault clearing to ensure system stability and equipment protection. It has a long and fascinating history that reflects the evolution of power systems and the development of protective devices to monitor the health of the power system equipment. This was a critical piece of the puzzle since faults on the power system required decision times much too fast for human intervention in order to protect critical components like generators, transformers. protection relays originated from simple fuses in the late 19th century. The first protection relay type TCB was developed in the early years of 1900.
