

The optical module s emitted optical power is too high

Overview

The Problem: The signal is too strong and is blinding or burning the receiver., connecting two switches in the same rack). The Fix: NEVER plug an ER or ZR module directly into another without. When the transmit optical power exceeds the nominal working range, it may cause the optical module to work abnormally, thus affecting the network data transmission, and users can carry out preliminary troubleshooting and localization in the following ways. · Low transmit optical power Impact: It. Today I will give you an answer to how to diagnose the cause and the corresponding solutions when the optical power of the optical module is too high or too low. Common Causes: Using a Long-Range module (like ZR 80km) for a Short-Range test (e. In communication, we usually use dBm to represent optical power.
