

What does P represent in relay protection

Overview

Plug Setting Multiplier (P.) is a measure of the sensitivity of a protective relay. A protective relay is a device that is used to protect electrical equipment from damage or failure. It is designed to detect abnormal conditions, such as a power surge or a short circuit, and respond by opening or closing electrical contacts. At present there are three platforms as shown below. These types of devices protect electrical systems and components from damage when an unwanted event occurs, such as an electrical. The protection and control devices in electrical equipment can be referred to by numbers, with appropriate suffix letters when necessary, according to the functions they perform. Three fundamental components required for each circuit breaker. CT's transform line current down to a signal level that is.
