

What to do about high loss in fiber optic patch cords for surveillance

Overview

Potential remedies include checking connections and connectors, altering antenna positioning, changing frequency or channel, upgrading hardware, and contacting an expert. You can restore signal strength and maintain reliable network performance by following these procedures. Unlike backbone cables, patch cords are frequently connected, disconnected, bent, and handled by technicians, making them the most vulnerable. Signal loss in Fiber Optic networks can make data slow. It can also break your connection. Each step helps you find problems and fix. Insertion loss is the signal power loss caused by inserting devices (such as fiber connectors, fiber jumpers, couplers, etc). A very common problem is that a connector is not fully engaged - often hard to notice in a crowded patch panel.
