

Which interface should be used for fiber optic cables in a switch

Overview

SFP (Small Form-factor Pluggable) is a compact, hot-pluggable network interface module used to connect network devices (switches, routers, firewalls) to fiber optic or copper cables. Ethernet switch port types define the performance, scalability, and architecture of modern networks. RJ45 ports serve access-layer copper connections; SFP/SFP+ ports enable flexible 1G/10G uplinks; SFP28 delivers 25G for modern data centers; QSFP+ and QSFP28 support high-density 40G/100G spine-leaf. In this guide, we'll break down the key differences between switch port Ethernet (RJ45) and switch port SFP to help you make an informed decision. A network switch is the heart of any local area network (LAN). These interchangeable modules support various media types, including copper or fiber-optic cables, providing flexible networking options based on specific requirements. Fiber provides: Increased internet signal bandwidth.
