

Which part of the optical module should be plugged into

Overview

Optical modules can either plug into a front panel socket or an on-board socket. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside. This installation note provides the installation instructions for the Cisco small form-factor pluggable (SFP) and SFP+ transceiver modules. These transceiver modules are hot-swappable input/output (I/O) devices that plug into 100BASE, 1000BASE and 10GBASE ports (for SFP+), which connect the module. Answer first: An SFP (Small Form Factor Pluggable) module is a hot-pluggable network transceiver that lets switches, routers, and servers link to fiber or copper and communicate reliably at 1G/10G/25G and beyond. 1G/10G SFP+: Standard for Gigabit and 10 Gigabit Ethernet. Align the SFP module with the optical port and insert it horizontally, pressing firmly until the bottom of the module engages with the locking spring of the optical interface. It converts electrical signals into optical (or copper) signals and vice versa.
